— H^\pm (Charged Higgs) MASS LIMITS —

NODE=S064HGC

Unless otherwise stated, the limits below assume $B(H^+ \rightarrow \tau^+ \nu) + B(H^+ \rightarrow c\bar{s}) = 1$, and hold for all values of $B(H^+ \rightarrow \tau^+ \nu_\tau)$, and assume H^+ weak isospin of $T_3 = +1/2$. In the following, $\tan\beta$ is the ratio of the two vacuum expectation values in two-doublet models (2HDM).

NODE=S064HGC

The limits are also applicable to point-like technipions. For a discussion of techniparticles, see the Review of Dynamical Electroweak Symmetry Breaking in this Review.

For limits obtained in hadronic collisions before the observation of the top quark, and based on the top mass values inconsistent with the current measurements, see the 1996 (Physical Review **D54** 1 (1996)) Edition of this Review.

Searches in $e^+ e^-$ collisions at and above the Z pole have conclusively ruled out the existence of a charged Higgs in the region $m_{H^+} \lesssim 45$ GeV, and are meanwhile superseded by the searches in higher energy $e^+ e^-$ collisions at LEP. Results that are by now obsolete are therefore not included in this compilation, and can be found in a previous Edition (The European Physical Journal **C15** 1 (2000)) of this Review.

In the following, and unless otherwise stated, results from the LEP experiments (ALEPH, DELPHI, L3, and OPAL) are assumed to derive from the study of the $e^+ e^- \rightarrow H^+ H^-$ process. Limits from $b \rightarrow s\gamma$ decays are usually stronger in generic 2HDM models than in Supersymmetric models.

| 1 LEP 13 give a limit that refers to the Type II scenario. The limit for $B(H^+ \rightarrow \tau \nu) = 1$ is 94 GeV (95% CL), and for $B(H^+ \rightarrow c s) = 1$ the region below 80.5 as well as the region 83–88 GeV is excluded (95% CL). LEP 13 also search for the decay mode $H^+ \rightarrow A^0 W^*$ with $A^0 \rightarrow b \bar{b}$, which is not negligible in Type I models. The limit in Type I models is 72.5 GeV (95% CL) if $m_{A^0} > 12$ GeV. | | NODE=S064HGC;LINKAGE=LE | |
| 2 ABBIENDI 12 also search for the decay mode $H^+ \rightarrow A^0 W^*$ with $A^0 \rightarrow b \bar{b}$. | | NODE=S064HGC;LINKAGE=AB | |
| 3 AAD 14M search for the decay cascade $H_2^0 \rightarrow H^\pm W^\mp \rightarrow H^0 W^\pm W^\mp, H^0$ decaying to $b \bar{b}$ in 20.3 fb^{-1} of $p\bar{p}$ collisions at $E_{cm} = 8$ TeV. See their Table III for limits on cross section times branching ratio for $m_{H_2^0} = 325\text{--}1025$ GeV and $m_{H^+} = 225\text{--}925$ GeV. | | NODE=S064HGC;LINKAGE=A | |
| 4 AALTONEN 14A measure $B(t \rightarrow b \tau \nu) = 0.096 \pm 0.028$ using 9 fb^{-1} of $p\bar{p}$ collisions at $E_{cm} = 1.96$ TeV. For $m_{H^+} = 80\text{--}140$ GeV, this measured value is translated to a limit $B(t \rightarrow b H^+) < 0.059$ at 95% CL assuming $B(H^+ \rightarrow \tau^+ \nu) = 1$. | | NODE=S064HGC;LINKAGE=B | |
| 5 AAD 13AC search for $t\bar{t}$ production followed by $t \rightarrow b H^+, H^+ \rightarrow c \bar{s}$ (flavor unidentified) in 4.7 fb^{-1} of $p\bar{p}$ collisions at $E_{cm} = 7$ TeV. Upper limits on $B(t \rightarrow b H^+)$ between 0.05 and 0.01 (95%CL) are given for $m_{H^+} = 90\text{--}150$ GeV and $B(H^+ \rightarrow c \bar{s}) = 1$. | | NODE=S064HGC;LINKAGE=GD | |
| 6 AAD 13V search for $t\bar{t}$ production followed by $t \rightarrow b H^+, H^+ \rightarrow \tau^+ \nu$ through violation of lepton universality with 4.6 fb^{-1} of $p\bar{p}$ collisions at $E_{cm} = 7$ TeV. Upper limits on $B(t \rightarrow b H^+)$ between 0.032 and 0.044 (95% CL) are given for $m_{H^+} = 90\text{--}140$ GeV and $B(H^+ \rightarrow \tau^+ \nu) = 1$. By combining with AAD 12BH, the limits improve to 0.008 to 0.034 for $m_{H^+} = 90\text{--}160$ GeV. See their Fig. 7 for the excluded region in the m_h^{\max} scenario of the MSSM. | | NODE=S064HGC;LINKAGE=AD | |
| 7 AAD 12BH search for $t\bar{t}$ production followed by $t \rightarrow b H^+, H^+ \rightarrow \tau^+ \nu$ with 4.6 fb^{-1} of $p\bar{p}$ collisions at $E_{cm} = 7$ TeV. Upper limits on $B(t \rightarrow b H^+)$ between 0.01 and 0.05 (95% CL) are given for $m_{H^+} = 90\text{--}160$ GeV and $B(H^+ \rightarrow \tau^+ \nu) = 1$. See their Fig. 8 for the excluded region in the m_h^{\max} scenario of the MSSM. | | NODE=S064HGC;LINKAGE=DA | |
| 8 CHATRCHYAN 12AA search for $t\bar{t}$ production followed by $t \rightarrow b H^+, H^+ \rightarrow \tau^+ \nu$ with 2 fb^{-1} of $p\bar{p}$ collisions at $E_{cm} = 7$ TeV. Upper limits on $B(t \rightarrow b H^+)$ between 0.019 and 0.041 (95% CL) are given for $m_{H^+} = 80\text{--}160$ GeV and $B(H^+ \rightarrow \tau^+ \nu) = 1$. | | NODE=S064HGC;LINKAGE=CH | |
| 9 AALTONEN 11P search in 2.7 fb^{-1} of $p\bar{p}$ collisions at $E_{cm} = 1.96$ TeV for the decay chain $t \rightarrow b H^+, H^+ \rightarrow W^+ A^0, A^0 \rightarrow \tau^+ \tau^-$ with m_{A^0} between 4 and 9 GeV. See their Fig. 4 for limits on $B(t \rightarrow b H^+)$ for $90 < m_{H^+} < 160$ GeV. | | NODE=S064HGC;LINKAGE=A5 | |
| 10 DESCHAMPS 10 make Type II two Higgs doublet model fits to weak leptonic and semileptonic decays, $b \rightarrow s \gamma, B, B_s$ mixings, and $Z \rightarrow b \bar{b}$. The limit holds irrespective of $\tan \beta$. | | NODE=S064HGC;LINKAGE=DE | |
| 11 AALTONEN 09AJ search for $t \rightarrow b H^+, H^+ \rightarrow c \bar{s}$ in $t\bar{t}$ events in 2.2 fb^{-1} of $p\bar{p}$ collisions at $E_{cm} = 1.96$ TeV. Upper limits on $B(t \rightarrow b H^+)$ between 0.08 and 0.32 (95% CL) are given for $m_{H^+} = 60\text{--}150$ GeV and $B(H^+ \rightarrow c \bar{s}) = 1$. | | NODE=S064HGC;LINKAGE=AA | |
| 12 ABAZOV 09AC search for $t \rightarrow b H^+, H^+ \rightarrow \tau^+ \nu$ in $t\bar{t}$ events in 0.9 fb^{-1} of $p\bar{p}$ collisions at $E_{cm} = 1.96$ TeV. Upper limits on $B(t \rightarrow b H^+)$ between 0.19 and 0.25 (95% CL) are given for $m_{H^+} = 80\text{--}155$ GeV and $B(H^+ \rightarrow \tau^+ \nu) = 1$. See their Fig. 4 for an excluded region in a MSSM scenario. | | NODE=S064HGC;LINKAGE=OZ | |
| 13 ABAZOV 09AG measure $t\bar{t}$ cross sections in final states with $\ell + \text{jets}$ ($\ell = e, \mu$), $\ell\ell$, and $\tau\ell$ in 1 fb^{-1} of $p\bar{p}$ collisions at $E_{cm} = 1.96$ TeV, which constrains possible $t \rightarrow b H^+$ branching fractions. Upper limits (95% CL) on $B(t \rightarrow b H^+)$ between 0.15 and | | NODE=S064HGC;LINKAGE=VO | |

- 0.40 (0.48 and 0.57) are given for $B(H^+ \rightarrow \tau^+ \nu) = 1$ ($B(H^+ \rightarrow c\bar{s}) = 1$) for $m_{H^+} = 80\text{--}155$ GeV.
- 14 ABAZOV 09AI search for $t \rightarrow bH^+$ in $t\bar{t}$ events in 1 fb^{-1} of $p\bar{p}$ collisions at $E_{\text{cm}} = 1.96$ TeV. Final states with $\ell + \text{jets}$ ($\ell = e, \mu$), $\ell\ell$, and $\tau\ell$ are examined. Upper limits on $B(t \rightarrow bH^+)$ (95% CL) between 0.15 and 0.19 (0.19 and 0.22) are given for $B(H^+ \rightarrow \tau^+ \nu) = 1$ ($B(H^+ \rightarrow c\bar{s}) = 1$) for $m_{H^+} = 80\text{--}155$ GeV. For $B(H^+ \rightarrow \tau^+ \nu) = 1$ also a simultaneous extraction of $B(t \rightarrow bH^+)$ and the $t\bar{t}$ cross section is performed, yielding a limit on $B(t \rightarrow bH^+)$ between 0.12 and 0.26 for $m_{H^+} = 80\text{--}155$ GeV. See their Figs. 5–8 for excluded regions in several MSSM scenarios.
- 15 ABAZOV 09P search for H^+ production by $q\bar{q}'$ annihilation followed by $H^+ \rightarrow t\bar{b}$ decay in 0.9 fb^{-1} of $p\bar{p}$ collisions at $E_{\text{cm}} = 1.96$ TeV. Cross section limits in several two-doublet models are given for $m_{H^+} = 180\text{--}300$ GeV. A region with $20 \lesssim \tan\beta \lesssim 70$ is excluded (95% CL) for 180 GeV $\lesssim m_{H^+} \lesssim 184$ GeV in type-I models.
- 16 ABULENCIA 06E search for associated $H^0 W$ production in $p\bar{p}$ collisions at $E_{\text{cm}} = 1.96$ TeV. A fit is made for $t\bar{t}$ production processes in dilepton, lepton + jets, and lepton + τ final states, with the decays $t \rightarrow W^+ b$ and $t \rightarrow H^+ b$ followed by $H^+ \rightarrow \tau^+ \nu, c\bar{s}, t^* \bar{b}$, or $W^+ H^0$. Within the MSSM the search is sensitive to the region $\tan\beta < 1$ or > 30 in the mass range $m_{H^+} = 80\text{--}160$ GeV. See Fig. 2 for the excluded region in a certain MSSM scenario.
- 17 ABDALLAH 04I search for $e^+ e^- \rightarrow H^+ H^-$ with H^\pm decaying to $\tau\nu, c\bar{s}$, or $W^* A^0$ in Type-I two-Higgs-doublet models.
- 18 ABBIENDI 03 give a limit $m_{H^+} > 1.28\tan\beta$ GeV (95%CL) in Type II two-doublet models.
- 19 ABAZOV 02B search for a charged Higgs boson in top decays with $H^+ \rightarrow \tau^+ \nu$ at $E_{\text{cm}} = 1.8$ TeV. For $m_{H^+} = 75$ GeV, the region $\tan\beta > 32.0$ is excluded at 95%CL. The excluded mass region extends to over 140 GeV for $\tan\beta$ values above 100.
- 20 BORZUMATI 02 point out that the decay modes such as $b\bar{b}W, A^0 W$, and supersymmetric ones can have substantial branching fractions in the mass range explored at LEP II and Tevatron.
- 21 ABBIENDI 01Q give a limit $\tan\beta/m_{H^+} < 0.53$ GeV $^{-1}$ (95%CL) in Type II two-doublet models.
- 22 BARATE 01E give a limit $\tan\beta/m_{H^+} < 0.40$ GeV $^{-1}$ (90% CL) in Type II two-doublet models. An independent measurement of $B \rightarrow \tau\nu_\tau X$ gives $\tan\beta/m_{H^+} < 0.49$ GeV $^{-1}$ (90% CL).
- 23 GAMBINO 01 use the world average data in the summer of 2001 $B(b \rightarrow s\gamma) = (3.23 \pm 0.42) \times 10^{-4}$. The limit applies for Type-II two-doublet models.
- 24 AFFOLDER 00I search for a charged Higgs boson in top decays with $H^+ \rightarrow \tau^+ \nu$ in $p\bar{p}$ collisions at $E_{\text{cm}} = 1.8$ TeV. The excluded mass region extends to over 120 GeV for $\tan\beta$ values above 100 and $B(\tau\nu) = 1$. If $B(t \rightarrow bH^+) \gtrsim 0.6$, m_{H^+} up to 160 GeV is excluded. Updates ABE 97L.
- 25 ABBOTT 99E search for a charged Higgs boson in top decays in $p\bar{p}$ collisions at $E_{\text{cm}} = 1.8$ TeV, by comparing the observed $t\bar{t}$ cross section (extracted from the data assuming the dominant decay $t \rightarrow bW^+$) with theoretical expectation. The search is sensitive to regions of the domains $\tan\beta \lesssim 1, 50 < m_{H^+} (\text{GeV}) \lesssim 120$ and $\tan\beta \gtrsim 40, 50 < m_{H^+} (\text{GeV}) \lesssim 160$. See Fig. 3 for the details of the excluded region.
- 26 ACKERSTAFF 99D measure the Michel parameters ρ, ξ, η , and $\xi\delta$ in leptonic τ decays from $Z \rightarrow \tau\tau$. Assuming $e\text{-}\mu$ universality, the limit $m_{H^+} > 0.97 \tan\beta$ GeV (95%CL) is obtained for two-doublet models in which only one doublet couples to leptons.
- 27 ACCIARRI 97F give a limit $m_{H^+} > 2.6 \tan\beta$ GeV (90% CL) from their limit on the exclusive $B \rightarrow \tau\nu_\tau$ branching ratio.
- 28 AMMAR 97B measure the Michel parameter ρ from $\tau \rightarrow e\nu\nu$ decays and assumes e/μ universality to extract the Michel η parameter from $\tau \rightarrow \mu\nu\nu$ decays. The measurement is translated to a lower limit on m_{H^+} in a two-doublet model $m_{H^+} > 0.97 \tan\beta$ GeV (90% CL).
- 29 COARASA 97 reanalyzed the constraint on the $(m_{H^\pm}, \tan\beta)$ plane derived from the inclusive $B \rightarrow \tau\nu_\tau X$ branching ratio in GROSSMAN 95B and BUSKULIC 95. They show that the constraint is quite sensitive to supersymmetric one-loop effects.
- 30 GUCHAIT 97 studies the constraints on m_{H^+} set by Tevatron data on $\ell\tau$ final states in $t\bar{t} \rightarrow (Wb)(Hb), W \rightarrow \ell\nu, H \rightarrow \tau\nu_\tau$. See Fig. 2 for the excluded region.
- 31 MANGANO 97 reconsiders the limit in ACCIARRI 97F including the effect of the potentially large $B_c \rightarrow \tau\nu_\tau$ background to $B_u \rightarrow \tau\nu_\tau$ decays. Stronger limits are obtained.
- 32 STAHL 97 fit τ lifetime, leptonic branching ratios, and the Michel parameters and derive limit $m_{H^+} > 1.5 \tan\beta$ GeV (90% CL) for a two-doublet model. See also STAHL 94.
- 33 ALAM 95 measure the inclusive $b \rightarrow s\gamma$ branching ratio at $\Upsilon(4S)$ and give $B(b \rightarrow s\gamma) < 4.2 \times 10^{-4}$ (95% CL), which translates to the limit $m_{H^+} > [244 + 63/(\tan\beta)^{1.3}]$ GeV in the Type II two-doublet model. Light supersymmetric particles can invalidate this bound.
- 34 BUSKULIC 95 give a limit $m_{H^+} > 1.9 \tan\beta$ GeV (90% CL) for Type-II models from $b \rightarrow \tau\nu_\tau X$ branching ratio, as proposed in GROSSMAN 94.

MASS LIMITS for $H^{\pm\pm}$ (doubly-charged Higgs boson)

This section covers searches for a doubly-charged Higgs boson with couplings to lepton pairs. Its weak isospin T_3 is thus restricted to two possibilities depending on lepton chiralities: $T_3(H^{\pm\pm}) = \pm 1$, with the coupling $g_{\ell\ell}$ to $\ell_L^- \ell_L^-$ and $\ell_R^+ \ell_R^+$ ("left-handed") and $T_3(H^{\pm\pm}) = 0$, with the coupling to $\ell_R^- \ell_R^-$ and $\ell_L^+ \ell_L^+$ ("right-handed"). These Higgs bosons appear in some left-right symmetric models based on the gauge group $SU(2)_L \times SU(2)_R \times U(1)$. These two cases are listed separately in the following. Unless noted, one of the lepton flavor combinations is assumed to be dominant in the decay.

LIMITS for $H^{\pm\pm}$ with $T_3 = \pm 1$

¹ AAD 12CQ search for $H^{++} H^{--}$ production with 4.7 fb^{-1} of pp collisions at $E_{cm} = 7 \text{ TeV}$. The limit assumes 100% branching ratio to the specified final state. See their Table 1 for limits assuming smaller branching ratios.

² CHATRCHYAN 12AU search for $H^{++} H^{--}$ production with 4.9 fb^{-1} of pp collisions at $E_{cm} = 7 \text{ TeV}$. The limit assumes 100% branching ratio to the specified final state. See their Table 6 for limits including associated $H^{++} H^-$ production or assuming different scenarios.

³ ABDALLAH 03 search for $H^{++} H^{--}$ pair production either followed by $H^{++} \rightarrow \tau^+ \tau^+$, or decaying outside the detector.

⁴ ABBIENDI 02C searches for pair production of $H^{++} H^{--}$, with $H^{\pm\pm} \rightarrow \ell^\pm \ell^\pm (\ell = e, \mu, \tau)$. The limit holds for $\ell = \ell' = \tau$, and becomes stronger for other combinations of leptonic final states. To ensure the decay within the detector, the limit only applies for $g(H\ell\ell) \gtrsim 10^{-7}$.

⁵ KANEMURA 14 examine the case where H^{++} decays preferentially to $W^{(*)} W^{(*)}$ and estimate that a lower mass limit of ~ 60 GeV can be derived from the same-sign dilepton data of AAD 12CY.

⁶ AAD 13Y search for $H^{++} H^{--}$ production in a generic search of events with three charged leptons in 4.6 fb^{-1} of pp collisions at $E_{cm} = 7 \text{ TeV}$. The limit assumes 100% branching ratio to the specified final state.

⁷ AAD 12AY search for $H^{++} H^{--}$ production with 1.6 fb^{-1} of pp collisions at $E_{cm} = 7 \text{ TeV}$. The limit assumes 100% branching ratio to the specified final state.

- 8 ABAZOV 12A search for $H^{++}H^{--}$ production in 7.0 fb^{-1} of $p\bar{p}$ collisions at $E_{\text{cm}} = 1.96 \text{ TeV}$.
 9 AALTONEN 11AF search for $H^{++}H^{--}$ production in 6.1 fb^{-1} of $p\bar{p}$ collisions at $E_{\text{cm}} = 1.96 \text{ TeV}$.
 10 AALTONEN 08AA search for $H^{++}H^{--}$ production in $p\bar{p}$ collisions at $E_{\text{cm}} = 1.96 \text{ TeV}$. The limit assumes 100% branching ratio to the specified final state.
 11 ABAZOV 08V search for $H^{++}H^{--}$ production in $p\bar{p}$ collisions at $E_{\text{cm}} = 1.96 \text{ TeV}$. The limit is for $B(H \rightarrow \mu\mu) = 1$. The limit is updated in ABAZOV 12A.
 12 AKTAS 06A search for single $H^{\pm\pm}$ production in $e\bar{p}$ collisions at HERA. Assuming that H^{++} only couples to $e^+\mu^+$ with $g_{e\mu} = 0.3$ (electromagnetic strength), a limit $m_{H^{++}} > 141 \text{ GeV}$ (95% CL) is derived. For the case where H^{++} couples to $e\tau$ only the limit is 112 GeV.
 13 ACOSTA 05L search for $H^{++}H^{--}$ pair production in $p\bar{p}$ collisions. The limit is valid for $g_{\ell\ell'} < 10^{-8}$ so that the Higgs decays outside the detector.
 14 ABAZOV 04E search for $H^{++}H^{--}$ pair production in $H^{\pm\pm} \rightarrow \mu^\pm\mu^\pm$. The limit is valid for $g_{\mu\mu} \gtrsim 10^{-7}$.
 15 ABBIENDI 03Q searches for single $H^{\pm\pm}$ via direct production in $e^+e^- \rightarrow e^+\mp e^{\mp}H^{\pm\pm}$, and via t -channel exchange in $e^+e^- \rightarrow e^+e^-$. In the direct case, and assuming $B(H^{\pm\pm} \rightarrow \ell^\pm\ell^\pm) = 1$, a 95% CL limit on $h_{ee} < 0.071$ is set for $m_{H^{\pm\pm}} < 160 \text{ GeV}$ (see Fig. 6). In the second case, indirect limits on h_{ee} are set for $m_{H^{\pm\pm}} < 2 \text{ TeV}$ (see Fig. 8).
 16 GORDEEV 97 search for muonium-antimuonium conversion and find $G_{M\bar{M}}/G_F < 0.14$ (90% CL), where $G_{M\bar{M}}$ is the lepton-flavor violating effective four-fermion coupling. This limit may be converted to $m_{H^{++}} > 210 \text{ GeV}$ if the Yukawa couplings of H^{++} to ee and $\mu\mu$ are as large as the weak gauge coupling. For similar limits on muonium-antimuonium conversion, see the muon Particle Listings.
 17 ASA KA 95 point out that H^{++} decays dominantly to four fermions in a large region of parameter space where the limit of ACTON 92M from the search of dilepton modes does not apply.
 18 ACTON 92M limit assumes $H^{\pm\pm} \rightarrow \ell^\pm\ell^\pm$ or $H^{\pm\pm}$ does not decay in the detector. Thus the region $g_{\ell\ell} \approx 10^{-7}$ is not excluded.
 19 ACTON 92M from $\Delta\Gamma_Z < 40 \text{ MeV}$.
 20 SWARTZ 90 assume $H^{\pm\pm} \rightarrow \ell^\pm\ell^\pm$ (any flavor). The limits are valid for the Higgs-lepton coupling $g(H\ell\ell) \gtrsim 7.4 \times 10^{-7}/[m_H/\text{GeV}]^{1/2}$. The limits improve somewhat for ee and $\mu\mu$ decay modes.

- 1 AAD 12CQ search for $H^{++}H^{--}$ production with 4.7 fb^{-1} of $p\bar{p}$ collisions at $E_{\text{cm}} = 7 \text{ TeV}$. The limit assumes 100% branching ratio to the specified final state. See their Table 1 for limits assuming smaller branching ratios.
 2 ABDALLAH 03 search for $H^{++}H^{--}$ pair production either followed by $H^{++} \rightarrow \tau^+\tau^+$, or decaying outside the detector.
 3 ACHARD 03F search for $e^+e^- \rightarrow H^{++}H^{--}$ with $H^{\pm\pm} \rightarrow \ell^\pm\ell'^\pm$. The limit holds for $\ell = \ell' = \tau$, and slightly different limits apply for other flavor combinations. The limit is valid for $g_{\ell\ell'} \gtrsim 10^{-7}$.
